

## Lecture 6

### Group Velocity, Poynting and Polarisation

## Group Velocity

- Phase velocity is the rate of advance of constant phase surfaces.
- Phase velocity can exceed velocity of light in vacuum,  $c$ .
- BUT phase velocity really only applies to infinite (time and space) monochromatic (sine) waves
- These do not exist - or if they do, are boring!!

## Propagation of Pulses

- Consider a gaussian pulse in time of width  $\Delta t$  - ie a sine wave multiplied by a gaussian
- By Fourier transforms we can show that this can be resolved into a superposition of sine waves, width  $2/\Delta t$
- In frequency space this is a delta function convolved with a Gaussian

Time Space

Frequency Space

## Representation

- Any superposition of sine waves can be represented as
- $E(t,z) = \text{Int}[ E_0(\omega) \exp i(k(\omega) z - \omega t ), d\omega ]$
- If the integrand is non-zero about a range of frequencies around  $\omega_0$  only
- Change variable to  $\Delta\omega = \omega - \omega_0$
- $k(\omega) = k(\omega_0) + dk/d\omega|_{\omega_0} \Delta\omega$  (Taylor expansion)
- $E(t,z) = \exp i(k(\omega_0) z - \omega_0 t ) \text{Int}[ E_0(\omega) \exp -i\Delta\omega ( t - dk/d\omega|_{\omega_0} z ) d\omega ]$
- First term is a carrier wave, propagating at the phase speed
- Second term is the modulation (information) traveling at the group velocity  $d\omega/dk|_{\omega_0}$
- $d\omega/dk = c / n(\omega) / ( 1 + (\omega/n) dn/d\omega )$
- The group velocity should be smaller than the speed of light....

## Group Velocity in Plasmas

- $n^2 = 1 - \omega_p^2 / \omega^2$
- If we assume that  $\omega_p < \omega$ , then  $n$  is real and  $< 1$
- The phase velocity is  $c/n$  which is  $> c$
- It is left as an exercise for the reader to show that....
- The group velocity is  $cn$  which is  $< c$
- This is not a general formula - it only applies to plasmas
- The group velocity is the velocity at which information can propagate
- There is no information in a monochromatic plane wave

## MEs in Linear, Isotropic Medium

- $\text{Div}[\mathbf{E}] = \rho/\epsilon$
- $\text{Div}[\mathbf{H}] = 0$
- $\text{Curl}[\mathbf{E}] = -\partial/\partial t (\mu \mathbf{H})$
- $\text{Curl}[\mathbf{H}] = \partial/\partial t (\epsilon \mathbf{E}) + \mathbf{J}$
- $\epsilon = \epsilon_0 (1 + \chi_e)$
- $\mu = \mu_0 (1 + \chi_m)$
- Notice that  $\mathbf{J}$  has not been replaced with the conductivity

## Poynting Vectors

- Start with  $\text{Div}[\mathbf{E} \times \mathbf{H}] = \mathbf{H} \cdot \text{Curl}[\mathbf{E}] - \mathbf{E} \cdot \text{Curl}[\mathbf{H}]$   
(general vector relationship)
- $\text{Div}[\mathbf{E} \times \mathbf{H}] = -\mathbf{H} \cdot \partial/\partial t (\mu \mathbf{H}) - \mathbf{E} \cdot \partial/\partial t (\epsilon \mathbf{E}) - \mathbf{E} \cdot \mathbf{J}$
- $\text{Div}[\mathbf{S}] + \partial/\partial t (\frac{1}{2} \mu H^2 + \frac{1}{2} \epsilon E^2) + \mathbf{E} \cdot \mathbf{J} = 0$
- Where  $\mathbf{S} = \mathbf{E} \times \mathbf{H}$
- The last term is a Joule heating term
- The second term is the rate of change of energy in the magnetic and electrostatic fields
- The first term can be interpreted as the energy flow with the Poynting vector pointing in the direction of energy flow
- Since  $\mathbf{S} = \mathbf{E} \times \mathbf{H}$  these form a right-handed set as expected from plane wave consideration

## Poynting and Plane Waves

- $\mathbf{S} = \mathbf{E} \times \mathbf{H}$
- Let's take time averages
- $\langle \mathbf{S} \rangle = \langle \text{Re}(\mathbf{E}) \times \text{Re}(\mathbf{H}) \rangle = \frac{1}{2} \text{Re} (\mathbf{E} \times \mathbf{H}^*)$
- But  $\mathbf{H}^* = \sqrt{\epsilon/\mu} \mathbf{k} \times \mathbf{E}^*$
- So  $\langle \mathbf{S} \rangle = \frac{1}{2} \sqrt{\epsilon/\mu} |E_0|^2 \mathbf{k}$
- The Poynting vector points in the direction of energy flow - the DOP in this case
- The magnitude is proportional to  $|E_0|^2$

## The General (Ugly) Case

- $\text{Div}[\mathbf{E} \times \mathbf{H}^*] - i\omega(\mu \mathbf{H} \cdot \mathbf{H}^* + \epsilon^* \mathbf{E} \cdot \mathbf{E}^*) + \mathbf{E} \cdot \mathbf{J}^* = 0$
- Real part of this equation as the power equation
- Power dissipated if the real part of 2nd term  $\neq 0$
- Only true if  $\mu, \epsilon$  are complex (imaginary  $\neq 0$ )
- Joule Heating occurs through the real part of  $\mathbf{E} \cdot \mathbf{J}^*$
- If  $\mathbf{J} = \sigma \mathbf{E}$ , then the real part of  $\sigma$  counts
- Lossless medium has real  $\mu, \epsilon$  and imaginary or zero  $\sigma$

## The Force of a Plane Wave

- A plane EM wave passes through a conducting region
- A current  $\mathbf{J}$  appears because of the electric field acting on the electrons
- A force  $\mathbf{F}$  appears because of the interaction of the moving electrons with the magnetic field
- $\mathbf{F} = \mathbf{J} \times \mu \mathbf{H}$  (per unit volume)
- But we can substitute from Mes
- $\mathbf{F} = (\text{Curl}[\mathbf{H}] - \partial/\partial t (\epsilon \mathbf{E})) \times \mu \mathbf{H}$
- After some substitution (it is left as an exercise..)
- $\mathbf{F} = -\mu \mathbf{H} \times \text{Curl}[\mathbf{H}] - \epsilon \mathbf{E} \times \text{Curl}[\mathbf{E}] - \epsilon \mu \partial/\partial t (\mathbf{E} \times \mathbf{H})$
- Third term is zero in steady state
- In plane wave only  $E_x, H_y \neq 0$  and  $\partial/\partial x, \partial/\partial y = 0$
- $\mathbf{H} \times \text{Curl}[\mathbf{H}] \rightarrow \frac{1}{2} \partial/\partial z (H_y^2) \mathbf{k}$
- $F_z = -\frac{1}{2} \partial/\partial z (\mu H_y^2 + \epsilon E_x^2) = -\partial U/\partial z$
- Force per unit volume = rate of decay of energy in waves with distance

## The Pressure of the Wave

- Force per unit volume is also the rate of change of pressure with distance (eg hydrostatic equation)
- Therefore the pressure  $p$  is equal to the energy density  $U$
- $U = \frac{1}{2} (\mu H_y^2 + \epsilon E_x^2)$  for the plane wave

## The Pressure of the Wave

- Pressure  $p = |\mathbf{S}|/c$
- In the general case this needs integrating over direction to account for solid angles - but we are ignoring that and using plane waves
- Pressure is force/unit area
- Force is rate of change of momentum  $p$
- $\partial p/\partial t = A P = A(1/c) |\mathbf{S}|$
- For a plane wave momentum/unit area is the energy in the beam/unit area divided by the speed of light
- COMPARE TO PHOTONS
- Photon energy =  $\hbar\omega$
- Photon momentum =  $\hbar\omega/c = \hbar k$
- In vector terms photon momentum =  $\hbar \mathbf{k}$
- Total energy in the beam =  $N \hbar\omega$

## Polarisation

- If light is a vector wave with an electric field and a magnetic field orthogonal to one another
- Then we can resolve any single wave propagating along the z axis into two parts with electric vectors along the x and y axes respectively -  $E_x$  and  $E_y$
- BUT it is possible that these are not in phase -there is a specific phase difference between the two waves
- Restrictions...
  - Not just any pair of fields will do
  - MUST have same frequency (exactly) and a defined phase relationship between them
- OBSERVABLE features can have many frequencies BUT must have a defined phase relationship which applies for all frequencies
- OBSERVABLE is formed of many sub-parts each of which is of a single frequency and defined phase relationship

## Some Common Polarisations

- $0, m\pi$  - total electric vector is a straight line at an angle given by  $\tan^{-1}(E_y/E_x)$  - linearly polarised
- $(2m+1)\pi/2$  and  $E_y = E_x$  - circularly polarised
- Anything else - elliptically polarised light
- All described by the locus of the vector
- $E_x \cos \omega t \mathbf{x} + E_y \cos(\omega t + \delta) \mathbf{y}$
- Or in complex notation  
 $E_x \exp i\omega t \mathbf{x} + E_y \exp i(\omega t + \delta) \mathbf{y} \rightarrow E_x \mathbf{x} + E_y \exp i\delta \mathbf{y}$

## Some Common Polarisations

## But You Can Only Measure Energy

- OK so we must characterise things in terms of energy quantities
- $s_0 = E_{ox}^2 + E_{oy}^2 = s_0$   
 = Total energy
- $s_1 = E_{ox}^2 - E_{oy}^2 = s_0 \sin 2\chi \cos 2\psi$   
 = Difference in energy
- $s_2 = 2 E_{ox} E_{oy} \cos(-\delta) = s_0 \sin 2\chi \sin 2\psi$
- $s_3 = 2 E_{ox} E_{oy} \sin(-\delta) = s_0 \cos 2\chi$
- Stokes Parameters - after Lord Stokes of course!

## Poincaré Sphere

- $s_0^2 = s_1^2 + s_2^2 + s_3^2$
- The angles  $2\chi$  and  $2\psi$  form the latitude and longitude on the sphere
- All polarisations of a single beam are points on the surfaces of the sphere
- Eg poles are circular polarisation
- Eg equator is linear polarisation

## The Real World

- See a sum of lots of little “wavelets” (except lasers!)
- Stokes parameters are energy-like quantities and can be added up for the sum of a set of “wavelets”
- $s_0 = \langle E_{ox}^2 \rangle + \langle E_{oy}^2 \rangle = s_0$
- $s_1 = \langle E_{ox}^2 \rangle - \langle E_{oy}^2 \rangle = s_0 \langle \sin 2\chi \cos 2\psi \rangle$
- $s_2 = 2 \langle E_{ox} E_{oy} \cos(-\delta) \rangle = s_0 \langle \sin 2\chi \sin 2\psi \rangle$
- $s_3 = 2 \langle E_{ox} E_{oy} \sin(-\delta) \rangle = s_0 \langle \cos 2\chi \rangle$

## Natural Light

- “Natural” light does not follow the restrictions on frequency and phase as previous discussion
- “Natural” light considered as random superposition of “wavelets” of random phasing
- $s_0^2 \geq s_1^2 + s_2^2 + s_3^2$
- For light from a thermal source
- $s_0 \gg 0, s_1 = s_2 = s_3 = 0$
- For white light from a linear polariser
- $s_0 = \pm s_1 \gg 0, s_2 = s_3 = 0$

## Radiometric Units

- Defined by history - not by logic!!
- Energy is the fundamental unit (J)
- Power is energy per unit time (W)
- Power per unit solid angle
  - “Pointance” -  $W \text{ sr}^{-1}$  - intensity
- Power per unit area
  - “areance” -  $W \text{ m}^{-2}$  - ??????
- Power per unit area per unit solid angle
  - “sterance” -  $W \text{ m}^{-2} \text{ sr}^{-1}$  - radiance

## Depends Upon Your Point of View

- For sources interested in...
  - Total power (W)
  - Power into a solid angle ( $\text{Wsr}^{-1}$ )
- For receivers interested in...
  - Total power per unit area ( $\text{Wm}^{-2}$ )
  - Power per unit area per unit solid angle ( $\text{Wm}^{-2}\text{sr}^{-1}$ )
